New protease (inhibitors) useful for diagnosis and treatment of autoimmune/inflammatory disorders such as acquired immunodeficiency syndrome, Cushing's disease, Addison's disease and cell proliferative Lu DAM; Azimzai Y, Baughn MR,

Claim 1; Page 95-96; 134pp; English.

AAPB1714 to AAPB1740 encode the human proteases and protease inhibitors

C (PPIMS) given in AAB74668 to AAB74634. The PPIMS can have activities such
as: anti-human immunodeficiency virus (HIV); antidiabetic; antithyroid;

Immunostinulant; immunomodulator; antiinflammatory; immunosuppressive;

c immunostinulant; immunomodulator; antiinflammatory; immunosuppressive;

c fungicide; protozoacide; antiarteriosclerotic; antiatherosclerotic;

tungicide; protozoacide; antiarteriosclerotic; antiatherosclerotic;

c fundicide; antipsoriatic; and hepatotropic. PPIM polymucleotide and

protein sequences can be used in the diagnosis, treatment and prevention

of autoimmune/inflammatory disorders such as AIDS, DiGeorge's syndrome,

severe combined immunodeficiency disease (SCID), Chediak-Higashi

c attoimmune/inflammatory disorders such as AIDS, DiGeorge's syndrome,

severe combined immunodeficiency disease (SCID), Chediak-Higashi

c groun's disease, diabetes meellitus, Good pasture's syndrome, Werner's

cyndrome, viral, bacterial, fungal, parasitic, protozoal, and helminthic

cherions and cell proliferative disorder such as arteriosclerosis,

atherosclerosis, cirrhosis, hepatitis, psoriasis and cancer. PPIM

c polymucleotide sequences can be used in somatic or germline gene therapy

c and in diagnosis of diseases. They can also be used in generating

c hybridisation probes useful in mapping the naturally occurring genomic

c sequences and in molecular biology techniques

preventing or treating disease, hepatitis, Cushing's New human proteases useful for diagnosing, preventing anorexia, myocardial infarction, Addison's disease, h syndrome, eczema, Parkinson's disease, and impotence.

Claim 1; Page 140-143; 168pp; English.

This invention relates to the DNA and protein sequences of novel isolated human proteases (PRTS). The protein sequences of the invention are useful correcting a compound for effectiveness as an agonist or antagonist of its activity, the identified agonist and antagonist are useful for recating a disease or condition associated with decreased or overspression of functional PRTS in a patient. The PRTS protein is also useful as an immunogen for preparing polyclonal or annoclonal antibodies by hybridoma technology. An antibody that binds the PRTS proteins is useful for detection and purification of the proteins and can be used to subject or in a biological sample. The sequences of the invention are cubject or in a biological sample. The sequences of the invention are useful for diagnosis, treatment and prevention of gastrointestinal cardiovascular such as atherosclerosis, hypertension, myocardial of infarction, etc; autoimmune/inflammatory disorders such as acquired immunodeficiency syndrome (AIDS), asthma, Grave's disease, etc; call covered idisorders such as hearthma, Grave's disease, etc; call disorders such as dermatitis, so soriasis, leukaemia etc; con a dermatitis, scabies, eczema, ect; neurological disorders such as cubing's syndrome; epithelial disorders such as cubing's syndrome; epithelial disorders such as dermatitis, acabies, eczema, ect; neurological disorders such as cubing's carders such as infertility, cimpotence. The present sequence represents the PRTS7 protein sequence of

New human ubiquitin protease, a member of the mammalian deubiquitinating enzymes is useful for diagnosis and treatment of e.g. tuberculosis and Alzheimer's disease.

Claim 5; Fig 1; 111pp; English.

The present sequence is human ubiquitin protease 21431. The ubiquitin protease coding sequence and protein are useful as reagents or targets in assays for treatment and diagnosis of ubiquitin-mediated or -related disorders, especially disorders mediated by deubiquitinating enzymes. The protein and coding sequence are also useful for treating disorders involving the following: the spleen e.g. tuberculosis and typhoid fever, the lung such as bronchial asthma, the colon e.g. as diarrhoea and dysentery, the liver e.g. jaundice and colones, acute meningitis and endometrium e.g. endometritis, the brain e.g. acute meningitis and Alzheimer disease, T-cells including transplant rejection and autoimmune

```
diseases such as systemic lupus erythematosus, diseases of the skin such as malignant melanoma, the bone marrow e.g. B- and T-lymboid leukaemias, the heart including myocardial infarction, red cells e.g. anaemia, the thymus e.g. Hodgkin disease, B-cells e.g. peripheral B-cell neoplasms, the kidney e.g. polycystic kidney disease, the breast including periductal mastifis, the testis and epididymis e.g. syphilis, the prostate e.g. nodular hyperplasia, the thyroid, e.g. syphilis, the skeletal muscle e.g. rhabdomyosarcoma, the pancreas e.g. ectopic skeletal muscle e.g. rhabdomyosarcoma, the pancreas e.g. ectopic -associated thrombocytopaenia and disorders involving precursor T-cell neoplasms including precursor T lymphoblastic leukaemia/lymphoma

(MILL-) MILLENNIUM PHARM INC

New nucleic acid or polypeptide, useful for preparing a composition for diagnosing or treating diseases e.g., tumor.

Claim 9; Fig 1; 281pp; English.

The invention relates to a new isolated nucleic acid molecule encoding one of 6 polypeptides (Lbiquitin protease, lipase, Dynamin, short Chain one of 6 polypeptides (Lbiquitin protease, lipase, Dynamin, short Chain and Capture of the contained of the contained of the contained of the contained of the contained of the polypeptide, host cells containing the nucleic acids, an antibody that selectively binds to the polypeptide, a method for producing the polypeptide and method for detecting the presence of the polypeptide or the nucleic acid in a sample, a method for identifying a compound that binds to the polypeptide of a method for compound that modulates the polypeptide and a method for identifying a compound that activity of the polypeptide. The nucleic acid or polypeptide is useful for preparing a composition for diagnosing or treating diseases e.g. spleen disorders (e.g. splenomegaly and Hodgkin's disease), lung disorders (e.g. adult respiratory distress syndrome, pulmonary oedema, chronic bronchits and emphysema), colon disorders (e.g. stenosis, colitis, inflammatory bowel disease and Crohn's disease), liver disorders (e.g. jaundice, cirrhosis, hepatitis and alcoholic liver disease), uterine and endometrial disorders (e.g. endometriosis and menopausal changes), brain disorders (e.g. encephalitis, Alzheimer's disease, Parkinson's disease, ataxia and multiple sclerosis), T-cell disorders (e.g. acquired immunodeficiency syndrome, AIDS), skin disorders

The present invention describes primer sets for synthesising 5602 full-
[and the specification. Where a primer set comprises:
[a) an oligo-dr primer and an oligonucleotide complementary to the
complementary strand of a polynucleotide which comprises one of the 5602
[a) an oligonucleotide comprising a sequence complementary to the
complementary strand of a polynucleotide which comprises a 5'-end
complementary strand of a polynucleotide which comprises a 5'-end
complementary strand of a polynucleotide which comprises a 5'-end
complementary strand of a polynucleotide which comprises a 5'-end
complementary strand of a polynucleotide which comprises a 5'-end
complementary strand of a polynucleotide specification.

CC sequence and an oligonucleotide complementary to a
cc plynucleotide which comprises a 3'-end sequence, where the
comprises at least 15 nucleotides and the combination of
the 5'-end sequence/3'-end sequence is selected from those defined in the
cc specification. The primer sets can be used in antisense therapy and in
cc specification. The primers are useful for synthesising polynucleotides,
cc detection and/or diagnosis of the abnormality of the proteins encoded by
cc detection and/or diagnosis of the abnormality of the proteins encoded by
cd the full-length cDNAs. The primers are also useful for the
cd comprises the complement and complementary and and complementary and and complementary and and complementary and and complementary and and complementary and and complementary specialised methods. AAH13613 to AAH18742 represent thuman and complementary and and complementary and and complementary and and the complementary and and the complementary and and the complementary and and the complementary and the exemplification of the
complementary specialised methods. AAH13612 represent
complementary and in the recent in the exemplification of the the present thuman and complementary and the complementary and the complementary and the complementary and the complementary and the complementary and the complementar
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Primer sets for synthesizing polynucleotides, particularly the 5602 full length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length

The invention relates to an isolated polynucleotide (I) comprising a nucleotide sequence selected from any of 948 sequences (ABZ11119-C nucleotide sequence selected from any of 948 sequences (ABZ11119-C DEC DEC OF THE PROFILE SEQUENCES OF THE POLYNUCLECTION ACTIVE domain coding fortune or complementary sequences. The polynucleotides are useful for identifying expressed games or for physical mapping of human genome. The clantifying expressed games or for physical mapping of human genome. The markers, as a food supplement, for generating antibodies, in medical imaging, screening and diagnostic assays and for treating cellinaping, screening and diagnostic assays and for treating cellinapines, screening and disgnostic assays and for treating cellinapines, as a food supplement, for generative diseases (Parkinson's proliferative disorders (ancer), neurodegenerative diseases (Parkinson's conflictedion disorders, wound, burns, incipie, incers, liver or lung fibrosis, infections (Dacterial, viral, fungal, parastic), or lung fibrosis, infections (Dacterial, viral, fungal, parastic), arthritis, etc. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format conflicted print pub/published_pct_sequences

New polynucleotides comprising sequences assembled from expressed sequence tags (ESTs), useful for treating cell-proliferative, neurodegenerative, autoimmune, genetic, myeloid or lymphoid, or platelet

Claim 9; SEQ ID NO 1338; 1012pp + Sequence Listing; English.

ABB06118 ID ABB06118 standard; protein; 558 AA. RESULT 7

ABB06118;

(first entry) 10-MAY-2002

Human NS protein sequence SEQ ID NO:210.

Human, cytostatic, osteopathic; gynaecological; neuroprotective;

W antirheumatic; antiarthritic; antipsoriatic; ophthalmological; anti-HIV;
W vasotropic, antiarterisotlerotic; antiinflammatory; dermatological;
W anorectic; muscular; antiinfertility; cardiovascular; anticoagulant;
W antifibrinolytic; hypotension; antiasthmatic; immunomodulator; cardiant;
W anticonvolsant; antidiabetic; tranquilliser; antidepressant; aeuroleptic;
W gastrointestinal; virucide; antiulcer; crebroprotective; mostropic;
W contraceptive; vaccine; gene therapy; cancer; osteoporosis; dystonia;
W contraceptive; degenerative disease; multiple sclerosis; glaucoma;
W inflammation; skin disorder; restenoiss; atherosclerosis; glaucoma;
W inflammation; skin disorder; obesity; muscular dystrophy; AIDS;
W inflammation; asthma; immune disease; coagulation disease; hypertension;
W ischaemia; asthma; immune disease; epilepsy; angina; neurodegeneration;
W gastric ulcer; Alzheimer's disease;

One hundred and twenty eight novel nucleic acid sequences, useful for treating and diagnosing e.g. cancer, asthma and Alzheimer's. hundred

Claim 6; Page 243-245; 290pp; English. A CONTRACTOR OF THE CONTRACTOR

```
CC ABL39691 to ABB139818 represent novel human nucleic acid sequences encoding the proteins given in ABB06037 to ABB06164. The novel sequences (NS) can have cytostatic, osteopathic, gynaecological, neuroprotective, antirichematic, antiarthritic, antipeoriatic, ophthalmological, virucide, vasotropic, antiarthritic, antiinflammatory, dermatological, antirichematic, antiarthritic, antiinflammatory, dermatological, anticoagulant, antifibrinolytic, hypotension, antiacthmatic, cardiant, anticoagulant, anticoarbinate, antidiabetic, tranquilliser, antiulcer, immunomodulator, anticonvulsant, auroleptic, creebroprotective, immunomodulator, anticonvulsant, auroleptic, creebroprotective, on the contraceptive activities. The NS can be used in vaccines, gene therapy and antisense therapy. Nucleic acids, expression vectors and diagnosing e.g. cancer, osteoporosis, endometriosis, degenerative diseases, dystonia, multiple sclerosis, rheumatoid arthritis, poriasis, cataracts, restenosis, atherosclerosis, inflammation, skin disorders, classase, disease, epilepsy, angina, neurodegeneration, astham, immune cd disease, epilepsy, angina, neurodegeneration, disbetes, anxiety, cordiners, viral disease, gastric ulcers, stroke, cordineraceptive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

                                                     02-AUG-2001
               The present invention relates to the isolation of novel human enzyme polypeptides, and the CDNA (AAS40785-AAS41684) and genomic sequences encoding them. The enzyme polypeptides of the invention may comprise the functional classes of oxidoreductases, transferases, hydrolases, lyases, isomerases or ligases. The sequences of the invention are useful in the disorders including hyperproliferative disorders (e.g. cancer), arthritis), neurological disorders (e.g. ALDS) autoimmune faisorders (e.g. arthritis), neurological disorders (e.g. ALDS) autoimmune (e.g. asthma), arthritis), neurological disorders (e.g. ALDS) inflammatory disorders (e.g. asthma), cardiovascular disorders (e.g. atheroscilerosis), blood-related disorders (e.g. thempylketonuria), inflammatory disorders (e.g. asthma), cardiovascular disorders (e.g. atheroscilerosis), blood-related disorders (e.g. infectious disorders (e.g. influenza). The polymoleotides of the invention can also be used in gene therapy, AAU22915-AAU23814 represent the novel human enzyme polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed specification, but the wipo.int/pub/published_pct_sequences
                                                                                                                                                                                       Novel polypeptides and polynucleotides useful for diagnosing, preventing, treating neural, immune system, muscular, reproductive, pulmonary, cardiovascular, renal, proliferative disorders and cancerous diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 VVYSSSSVPDKSKPSPQKDQALGDGIAPPQKVLFPSEKICLKWQQTHRVGAGLQNLGNTC 120

```
The present invention relates to the isolation of novel human enzyme polypeptides, and the CDNA (AAS40785-AAS41684) and genomic sequences concoding them. The enzyme polypeptides of the invention may comprise the functional classes of oxidoreductases, transferases, hydrolases, lyases, functional classes of oxidoreductases, transferases, hydrolases, lyases, concornances or ligases. The sequences of the invention are useful in the disorders including hyperproliferative disorders (e.g. cancer), alsorders (e.g. albeiner's disorders (e.g. infertility) and cardiovascular disorders (e.g. infertility) and cardiovascular disorders (e.g. infertility) and cardiovascular disorders (e.g. infertility) and cardiovascular disorders (e.g. infertility) and cardiovascular disorders (e.g. infertility) and cardiovascular disorders (e.g. infertility) and cardiovascular disorders (e.g. infertility) and cardiovascular disorders (e.g. infertility) and cardiovascular disorders (e.g. infertility) and cardiovascular did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           61 VVYSSSSVPDKSKPSPQKDQALGDGIAPPQKVLFPSEKICLKWQQTHRVGAGLQNLGNTC 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to human polymucleotides (AAI79941-AAI93841) and the encoded proteins (AAO00010-AAO13910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, activity, tissue growth factor activity, immunomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activity, inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                             Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                       VVYSSSSVPDKSKPSPQKDQALGDGIAPPQKVLFPSEKICLKWQQTHRVGAGLQNLGNTC 120

Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human cervical epithelial cells.
                                                                                                                                                                                                                                                                                                          The present invention relates to human single exon nucleic acid probes (SENP: see AAI10068-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human Hela cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               591 PVMNGKSKLNSSVLVPYGAESSEDSDEESKGLGKENGIGTIVSSHSPGQDAEDEEATPHE

The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foctal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New spatially-addressable set of single exon nucleic acid probes, useful for measuring gene expression in sample derived from human breast, comprises number of single exon nucleic acid probes.
exon nucleic acid probes useful for analyzing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; microarray; single exon probe; gene expression; breast; disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human breast and BT 474 cells. The method involves contacting the

probes with a collection of detectably labelled nucleic acids derived from mRNA of human breast, and then measuring the label bound to each probe of the microarray. The probes are useful for verifying the expression of regions of genomic DNA predicted to encode proteins. They are useful for gene discovery, and for determining predisposition and/or prognosing breast disease. Gene expression analysis is useful for assessing the toxicity of chemical agents on cells. The microarray of this invention presents a far greater diversity of probes for measuring gene expression, with far less bias than expressed sequence tag microarrays. The method is suitable for rapid production of functional information from genomic acquence. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human genome-derived single exon nucleic acid probes useful for analyzing

```

(see AAI00010-AAI10067). The present sequence is a peptide encoded by one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe hybridises at high stringency to a nucleic acid expressed in the human breast. The probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic inflammatory diseases include: breast cancer, disorders of development, breast disease and non-carcinoma tumours. Note: The sequence data for this patent did not form part of the printed specification, but was fitp.wipo.int/pub/published_pct_sequences

present invention relates to novel single exon nucleic acid probes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Pudlak syndrome, sarcoidosis, pulmonary haemosiderosis, pulmonary hastocytosis, pulmonary hastocytosis, pulmonary hastocytosis, lymphangioleiomyomtosis, pulmonary alveolar proteinosis, histocytosis, lymphangioleiomyomtosis, pulmonary alveolar proteinosis, dyskinesis, pulmonary hypertension and hyaline membrane disease. The present sequence is a peptide/protein encoded by a single exon probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
(b) measuring the label detectably bound to each probe of the

Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human fetal liver.
                                                                                                                                    (SENP: see AA110068-AA129459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human Hela cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                0
                                                                    Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human cervical epithelial cells.
                                                                                                                                                                                                                                                                                                                                                                                                    9

The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                 82 LGDGIAPPQKVLFPSEKICLKWQQTHRVGAGLQNLGNTCFANAALQCLTYTPPLANYMLS 141
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human genome-derived single exon nucleic acid probes useful for analyzing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to single exon nucleic acid probes (SENP: see AA131315-AA157546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Peptide #4909 encoded by probe for measuring placental gene expression.

nucleic acid probes for measuring gene expression in a sample derived nucleic acid probes for measuring gene expression in a sample derived from human breast and BT 474 cells. The method involves contacting the probes with a collection of detectably labelled nucleic acids derived from mRNA of human breast, and then measuring the label bound to each probe of the microarray. The probes are useful for verifying the case of regions of genomic DNA predicted to encode proteins. They are useful for gene discovery, and for determining predisposition and/or prognosing breast disease. Gene expression analysis is useful for sessing the toxicity of chemical agents on cells. The microarrays of this invention presents a far greater diversity of probes for measuring gene expression, with far less bias than expressed sequence tag microarrays. The method is suitable for rapid production of functional information from genomic sequence. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed
                                                                                         ö
                                                                                                                                                           09
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New spatially-addressable set of single exon nucleic acid probes, useful for measuring gene expression in sample derived from human breast, comprises number of single exon nucleic acid probes.

They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human genome-derived single exon nucleic acid probes useful for analyzing

The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, shyperlipporceinaemia, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. ABG47348-ABG5930 represent human liver single exon encoded peptides of the invention. Note: The sequence information for this patent does not appear in the printed specification but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/publish.ed_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        82 LGDGIAPPOKVLFPSEKICLKWQQTHRVGAGLQNLGNTCFANAALQCLTYTPPLANYMLS 141
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human adult liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1 LGDGIAPPQKVLFFSSEKICLKWQQTHRVGAGLQNLGNTCFANAALQCLTYTPPLANYMLS
                                                                                                             Human, liver, cirrhosis, hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia, coronary heart disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .;

Novel single exon nucleic acid probe used to measuring gene expression in human breast,

Claim 27; SEQ ID NO 14737; 322pp; English.

The present invention relates to novel single exon nucleic acid probes such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe hybridises at high stringency to a nucleic acid expressed in the human breast. The probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic actiology. The diseases include breast cancer, disorders of development, inflammatory diseases of the breast, fibrocystic changes, proliferative breast disease and non-carcinoma tumours. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

Spatially-addressable set of single exon nucleic acid probes, used to measure gene expression in human lung samples.

Claim 27; SEQ ID NO 29879; 634pp; English.

The invertion transfer to a specially addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one of 12614 nucleic acid sequences mentioned in the specification, or their complements or the 12387 open reading frames derived from the 12614 probes. Also included are a microarray comprising the novel set of probes of the novel set of probes which hybridise at high stringency to a nucleic acid expressed in the human lung; measuring gene expression in a sample derived from human lung; comprising (a) contacting the array with a collection of detectably labeled nucleic acids derived from human lung comprising (a) contacting the array; identifying exons in a evalvotic genome, comprising (a) array; identifying exons in a evalvotic genome, comprising (a) algorithmically predicting at least one exon from genomic sequences of the eukaryote; and (b) detecting specific hybridisation of detectably labeled nucleic acids from enkaryote lung mRNA, to a single exon probe, having a fragment identical to the predicted exon, the probe is included in the above mentioned microarray; assigning exons to a single gene, committed in the above mentioned microarray; assigning exons to a single gene, tissues and/or cell types using hybridisation to a single exon microarrays having a probe with the exon, where a common pattern of expression of the exons in the tissues and/or cell types indicates that the exons should be assigned to a single gene, a peptide comprising one of 12011 sequences, mentioned in the specification, or encoded by the probes/open reading frames (ORF). The probes are used for gene expression analysis, and for identifying exons in a gene, particularly using human comprising (a) identifying exons from genomic sequence by the method above and (b) measuring the expression of each of the exons in several The invention relates to a spatially-addressable set of single exon

 lung derived mRNA and for the study of lung diseases such as asthma, lung decareer chronic obstructive pulmonary disease (COPD), interstitial lung disease (LID), familial idiopathic pulmonary fibrosis, neurofibromatosis, tuberous sclerosis, Gaucher's disease, Niemann-Pick disease, Hermansky-Pudlak syndrome, sarcoidosis, pulmonary haemosiderosis, pulmonary histiocytosis, lymphangiolelomyoneosis, pulmonary alveolar proteinosis, Karagener syndrome, fibrocystic pulmonary dysplasia, primary ciliary dyskinesis, pulmonary hypertension and hyaline membrane disease. The present sequence is a peptide/protein encoded by a single exon probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ffp.wipo.int/pub/published_pct_sequences
for the study of lung diseases such as asthma, lung

Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis.

Claim 11; SEQ ID NO 12119; 3071pp + Sequence Listing; English.

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) cuplenced acids into a host cell and culturing the cell to express the protein and polynucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoietic-related diseases, especially a cancers and cancer metastases of haematopoietic-derived cells. AAK64703 sequences from the present invention. AAKS4942 to AAKS4950 and AAM82169 represent sequences used in the exemplification of the present invention to AAK87694 represent human immune/haematopoietic antigen genomic

The enzymes designated hDUB4 are located on chromosome 4, and the enzymes designated hDUB8 are located on chromosome 8. Also described is a method for reducing inflammation, modulating autoimmune diseases and modulating immune reactions during infections by administering a compound (A) that inhibits (I) or alters regulation of the transcription of nucleic acid sequences encoding (I). (I) has antiinflammatory and immunosuppressive activities, and can be used in the regulation of cytokine/cytokine receptor signaling involved in lymphocyte proliferation. (I) can be used for identifying their respective inhibitors (A) are useful for reducing inflammation and to modulate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes human deubiquitinating protease enzymes (I), designated hDUB. The enzymes designated hDUB4 are located on chromosome 4, and the enzymes designated hDUB8 are located on chromosome 8. Also described is a method for reducing inflammation, modulating autoimmune diseases and modulating immune reactions during infections by administering a compound (A) that inhibits (I) or alters regulation of the transcription of nucleic acid sequences encoding (I). (I) has antiinflammatory and immunosuppressive activities, and can be used in the regulation of cytokine/cytokine receptor signaling involved in lymphocyte proliferation. (I) can be used for identifying their respective inhibitors (A). (A) are useful for reducing inflammation and to modulate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated polynucleotide encoding human deubquitinating proteases, useful for identifying e.g. antiinflammatory or immunosuppressive agents, also the encoded polypeptides.
                                                                                                                                       human, deubiquitinating protease, enzyme, hDUB, DUB, autoimmune disease, infection, antiinflammatory; immunosuppressive; hDUB8; chromosome 8.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              autoimmune diseases or immune reactions during infections. The present sequence represents hDUB8.10 from the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes human deubiquitinating protease enzymes chromosome 4, and the enzymes designated hDUB4 are located on chromosome 4. Also described is a rethod for reducing inflammation, modulating autoimmune diseases and modulating inflammation, modulating autoimmune diseases and modulating immune reactions during infections by the transcription of mucleic acid sequences encoding (1). (1) has antiinflammatory and immunosuppressive activities, and can be used in the regulation of cyrokine/cyrokine receptor signaling involved in lymphocyte proliferation. (1) can be used for identifying their respective inhibitors (A). (A) are useful for reducing inflammation and to modulate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated polynucleotide encoding human deubquitinating proteases, useful for identifying e.g. antiinflammatory or immunosuppressive agents, also the encoded polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      autoimmune diseases or immune reactions during infections. The present sequence represents hDUE8.2 from the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   enzyme; human; protease
```

```
The invention relates to a novel isolated polypeptide comprising an amino acid sequence that has greater than 95 % identity to any one of 47 150-350 residue protease polypeptide sequences, given in the specification. The nucleic acids, probes, primers, polypeptides and antibodies of the invention can be used in methods of diagnosis of a susceptibility to a disease or condition associated with a protease. The present sequence represents a protease of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; protease; PRTS-11; enzyme; gastritis; cirrhosis; Crohn's disease; gastrointestinal disorder; autoimmune; inflammatory; cell proliferative; cardiovascular; developmental; epithelial; neurological; reproductive; AIDS; Acquired Immune Deficiency Syndrome; allergy; rheumatoid arthritis; anaemia; asthma; atherosclerosis; hypertension; myocardial infarction; hepatitis; cancer; psoriasis; Cushing's syndrome, hypothyroidism; carema; epilepsy; Alzheimer's disease; Huntington's disease; Parkinson's disease; pick's disease;

The invention relates to an isolated human protease polypeptide (PRTS).

PRTS protein and DNA are useful for diagnosing, treating and preventing gastrointestinal disorders (gastriis, cirrhosis, Crohn's disease).

Cautoimmune/inflammatory disorders (ALDS, allerty, rheumatoid arthritis, aneemia, asthma), cardiovascular disorder (atherosclerosis, hypertension, myocariasis), developmental disorders (Cushing's syndrome, hypothyroidism), epithelial disorder (vitiligo, keloid, eczema), neurological disorders (epithepsy, Alzheimer's disease, pick's disease, Huntington's disease, Parkinson's disease, and reproductive disorders (infertility). PRTS (Protein is useful in a number of drug screening techniques and to analyse the proteome of a tissue or cell type. PRTS DNA is useful for creating concein humanised animals or transgenic animals to model human diseases, in somatic or germline gene therapy and in microarrays utilising fluids or transgenic survey. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ·

The present invention describes human deubiquitinating protease enzymes (1), designated hDUB. The enzymes designated hDUB4 are located on chromosome 4, and the enzymes designated hDUB8 are located on chromosome 8. Also described is a method for reducing inflammation, modulating autoimmune diseases and modulating immune reactions during infections by administering a compound (A) that inhibits (I) or alters regulation of the transcription of nucleic acid sequences encoding (I). (I) has antiinflammatory and immunosuppressive activities, and can be used in the regulation of cytokine/cytokine receptor signaling involved in lymphocyte proliferation. (I) can be used for identifying their respective inhibitors (A). (A) are useful for reducing inflammation and to modulate autoimmune diseases or immune reactions during infections. The present sequence represents hDUB4.4 from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated polynucleotide encoding human deubquitinating proteases, useful for identifying e.g. antiinflammatory or immunosuppressive agents,
                                            New isolated polynucleotide encoding human deubquitinating proteases, useful for identifying e.g. antiinflammatory or immunosuppressive agents, also the encoded polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               human; deubiquitinating protease; enzyme; hDUB; DUB; autoimmune disease; infection; antiinflammatory; immunosuppressive; hDUB4; chromosome 4.

The present invention describes human deubiquitinating protease enzymes (I), designated hDUB. The enzymes designated hDUB4 are located on chromosome 4, and the enzymes designated hDUB9 are located on chromosome 8. Also described is a method for reducing inflammation, modulating autoimmune diseases and modulating immune reactions during infections by administering a compound (A) that inhibits (I) or alters regulation of autinflammatory and immunosuppressive activities, and can be used in the regulation of cytokine/cytokine receptor signaling involved in lymphocyte proliferation. (I) can be used for identifying their respective inhibitors (A). (A) are useful for reducing inflammation and to modulate autoimmune diseases or immune reactions during inflammation and to modulate sequence represents hDUE4.9 from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; deubiquitinating protein; Dubl1; Dubl2; immune disorder;

```
The invention relates to a number of primate and/or rodent proteins, and the genes which encode them. The invention encompasses human dendritic cell prostaglandin transporter (DC-PGT); the TNF (tumour necrosis factor) receptor family-related proteins HPMTDA84 HSLUD37R and RANKI; human CC chemokine HCC5; human deubiquitinating proteins Dabli and Dub 12; human CC chemokine HCC5; human deubiquitinating proteins Dub1 and Dub 12; human CC is compared for proteins comprising a leucine-rich motif (LRR); human cyclin E2; cDNAs encoding these proteins; and antibodies against these proteins. CC ligands for proteins comprising a leucine-rich motif (LRR); human cyclin E2; cDNAs encoding these proteins; and antibodies against these proteins. CC interactions can be used for mediate uptake of substrates (e.g., prostaglandin-like molecules), to modulate or mediate cellular or interactions of e.g., induce or prevent trafficking, proliferation, or differentiation of cells), or are intracellular proteins which are important in various cellular processes such as the deubiquitination of medical conditions such as immune, inflammatory or allergic disorders, or abnormal cellular proliferation, for example, cancers or degenerative conditions such as immune, inflammatory or allergic disorders, or abnormal cellular proliferation, for example, cancers or degenerative conditions such as immune, including rheumatoid arthritis, as well estable active and chronic inflammatory responses in which T cell activation, expansion, and/or immunological T cell memory play an important role. CDMD) and and/or immunological T cell memory play an important role. CDMD: ARYT7470-Y77471 encode Dubl: proteins and AAYT7472-Y77473 encode

The invention relates to a novel chemokine, de-ubiquitination or cell surface protein. The composition is useful for modulating physiology or development of a cell or tissue culture cells. The present sequence represents the amino acid sequence of the updated human de-ubiquitination protein Dubl

Kapeller-Libermann R;

WPI; 2003-447421/42. N-PSDB; ACA61698. New 68999 nucleic acid molecule, useful for treating, preventing and/or diagnosing 68999-mediated disorders, e.g. cancer, diabetes, arrhythmia, pain or obesity, and in chromosome mapping, tissue typing and forensic biology.

Claim 13; Page 40-41; 49pp; English

The invention relates to an isolated 68999 nucleic acid molecule which encodes a ubiquitin carboxyl-terminal hydrolase. The nucleic acid monodes a ubiquitin carboxyl-terminal hydrolase. The nucleic acid molecules, polypeptides and antibodies are useful in screening assays, predictive medicine (e.g. diagnostic assays, prognostic assays, predictive medicine (e.g. diagnostic assays, prognostic assays, cherapeutic methods. The nucleic acid may also be used in chromosome therapeutic methods. The nucleic acid and polypeptide may be used for treating, preventing and/or nucleic acid and polypeptide may be used for treating, preventing and/or differentiation disorders, such as cell proliferation and/or differentiation disorders (e.g. Parkinson's or Alzheimer's disorders, neurological disorders (e.g. Parkinson's or Alzheimer's disorders (e.g. oisteoporosis and rickets), immune disorders (e.g. diabetes and multiple sclerosis), cardiovascular disorders (e.g. arrhythmias congestive heart failure), blood vessel disorders (e.g. propriesis and Grave's disease) linyer disorders (e.g. hypertension and Kawasaki syndrome), endothelial cell disorder (e.g. hypertension and kawasaki syndrome), endothelial cell disorder (e.g. postrabis and drave's disease) linyer disorders (e.g. obesity or

The present invention describes human deubiquitinating protease enzymes (I), designated hDUB. The enzymes designated hDUB4 are located on chromosome 4, and the enzymes designated hDUB8 are located on chromosome 8. Also described is a method for reducing inflammation, modulating autoimmune diseases and modulating immune reactions during infections by administering a compound (A) that inhibits (I) or alters regulation of the transcription of nucleic acid sequences encoding (I). (I) has antiinflammatory and immunosuppressive activities, and can be used in the regulation of cytokine/zytokine receptor signaling involved in lymphocyte proliferation. (I) can be used for identifying their respective inhibitors (A). (A) are useful for reducing inflammation and to modulate autoimmune diseases or immune reactions during infections. The present sequence represents hDUB4.7 from the present invention.
                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated polynucleoride encoding human deubquitinating proteases, useful for identifying e.g. antiinflammatory or immunosuppressive agents, also the encoded polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                      human; deubiquitinating protease; enzyme; hDUB; DUB; autoimmune disease; infection; antiinflammatory; immunosuppressive; hDUB4; chromosome 4.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes human deubiquitinating protease enzymes (I), designated hDUB. The enzymes designated hDUB4 are located on chromosome 4, and the enzymes designated hDUB4 are located on chromosome B. Also described is a method for reducing inflammation, modulating autoimmune diseases and modulating immune reactions during infections by administering a compound (A) that inhibits (I) or alters regulation of the transcription of nucleic acid sequences encoding (I). (I) has antiinflammatory and immunosuppressive activities, and can be used nutinflammatory and immunosuppressive activities, and can be used proliferation. (I) can be used for identifying their respective inhibitors (A). (A) are useful for reducing inflammation and to modulate autoimmune diseases or immune reactions during infections. The present sequence represents hDUB8.5 from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated polynucleotide encoding human deubquitinating proteases, useful for identifying e.g. antiinflammatory or immunosuppressive agents,

The enzymes designated hDUB4 are located on chromosome 4, and the enzymes designated hDUB8 are located on chromosome 8. Also described is a method for reducing inflammation, modulating autoimmune diseases and modulating immune reactions during infections by administering a compound (A) that inhibits (I) or alters regulation of the transcription of nucleic acid sequences encoding (I). (I) has antiinflammatory and immunosuppressive activities, and can be used antiinflammatory and immunosuppressive activities, and can be used proliferation of cytokine/cytokine receptor signaling involved in lymphocyte proliferation. (I) can be used for identifying their respective inhibitors (A). (A) are useful for reducing inflammation and to modulate autoimmune diseases or immune reactions during infections. The present sequence represents hDUB4.6 from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated polynucleotide encoding human deubquitinating proteases, useful for identifying e.g. antiinflammatory or immunosuppressive agents, also the encoded polypeptides.
                                                                              human; deubiquitinating protease; enzyme; hDUB; DUB; autoimmune disease; infection; antiinflammatory; immunosuppressive; hDUB4; chromosome 4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             human; deubiquitinating protease; enzyme; hDUB; DUB; autoimmune disease; infection; antiinflammatory; immunosuppressive; hDUBB; chromosome 8.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The present invention describes human deubiquitinating protease enzymes (I), designated hDUB. The enzymes designated hDUB4 are located on chromosome 4, and the enzymes designated hDUB8 are located on chromosome 8. Also described is a method for reducing inflammation, modulating autoimmune diseases and modulating immune reactions during infections by administering a compound (A) that inhibits (I) or alters regulation of the transcription of rucleic acid sequences encoding (I). (I) has antiinflammatory and immunosuppressive activities, and can be used in the regulation of cytokine/cytokine receptor signaling involved in lymphocyte proliferation. (I) can be used for identifiying their respective inhibitors (A). (A) are useful for reducing inflammation and to modulate autoimmune diseases or immune reactions during infections. The present sequence represents hDUB8.7 from the present invention.
                                                                                                                                                                                                                                                                                                                                     New isolated polynucleotide encoding human deubquitinating proteases, useful for identifying e.g. antiinflammatory or immunosuppressive agents, also the encoded polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             human, deubiquitinating protease, enzyme; hDUB; DUB; autoimmune disease; infection; antiinflammatory; immunosuppressive; hDUB4; chromosome 4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 2.1%; Score 16; DB 7; Length 530;

The present invention describes human deubiquitinating protease enzymes (I), designated hDUB. The enzymes designated hDUB4 are located on chromosome 4, and the enzymes designated hDUB8 are located on chromosome 8. Also described is a rethod for reducing inflammation, modulating autoimmune diseases and modulating immune reactions during infections by administering a compound (A) that inhibite (I) or alters regulation of the transcription of nucleic acid sequences encoding (I). (I) has antiinflammatory and immunosuppressive activities, and can be used in the regulation of cytokine/cytokine receptor signaling involved in lymphocyte proliferation. (I) can be used for identifying their respective inhibitors (A). (A) are useful for reducing inflammation and to modulate autoimmune diseases or :mmune reactions during infections. The present sequence represents hDUB4.3 from the present invention.
                                                                                                                                                                         New isolated polynucleotide encoding human deubquitinating proteases, useful for identifying e.g. antiinflammatory or immunosuppressive agents, also the encoded polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              human; deubiquitinating protease; enzyme; hDUB; DUB; autoimmune disease; infection; antiinflamma:ory; immunosuppressive; hDUB4; chromosome 4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .;

```
The present invention describes human deubiquitinating protease enzymes (I), designated hDUB. The enzymes designated hDUB4 are located on chromosome thromosome 4, and the enzymes designated hDUB4 are located on chromosome 8. Also described is a method for reducing inflammation, modulating autoimmune diseases and modulating immune reactions during infections by administering a compound (A) that inhibits (I) or alters regulation of the transcription of nucleic acid sequences encoding (I). (I) has antiinflammatory and immunosuppressive activities, and can be used in the regulation of cytokine/cytokine receptor signaling involved in lymphocyte proliferation. (I) can be used for identifying their respective in humbicors (A). (A) are useful for reducing inflammation and to modulate autoimmune diseases or immune reactions during infections. The present sequence represents hDUB4.8 from the present invention.
                                                                                           New isolated polynucleotide encoding human deubquitinating proteases, useful for identifying e.g. antiinflammatory or immunosuppressive agents,
                                                                                                                                                                                                                                                                                                                                  Claim 2; SEQ ID NO 20; 201pp; English.
                                                                                                                                                                                                                                 also the encoded polypeptides.

The present invention describes human deubiquitinating protease enzymes (I), designated hDUB. The enzymes designated hDUB4 are located on chromosome 4, and the enzymes designated hDUB8 are located on chromosome 8. Also described is a method for reducing inflammation, modulating autoimmune diseases and modulating immune reactions during infections by administering a compound (A) that inhibits (I) or alters regulation of the transcription of mucleic acid sequences encoding (I). (I) has antiinflammatory and immunosuppressive activities, and can be used in the regulation of cytokine/cytokine receptor signaling involved in lymphocyte proliferation. (I) can be used for identifying their respective inhibitors (A). (A) are useful for reducing inflammation and to modulate autoimmune diseases or immune reactions during infections. The present sequence represents hDUB4.2a from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated polynucleotide encoding human deubquitinating proteases, useful for identifying e.g. antiinflammatory or immunosuppressive agents, also the encoded polypeptides.

The invention relates to 971 novel human cDNA sequences (ADC29919-ADC30889) and the polypeptides they encode (ADC30890-ADC31860). The invention also relates to nucleic acid sequences over 99$ identical with the novel human cDNAs. The invention additionally encompasses expression vectors and host cells comprising a nucleic acid of the invention; the recombinant production of a polypeptide of the invention; an antibody against a polypeptide of the invention; an antibody against a polypeptide of the invention; and methods of polypeptides of the invention; and methods of invention and invention of invention which binds to a polypeptide of the invention. The invention further disc10ses methods of polypeptide of the invention. The invention further disc10ses methods of polypeptide of the invention and/or monoclonal antibodies for carrying out the methods of the invention or amaliorating a medical condition; kits comprising polymudectide probes and/or monoclonal antibodies for carrying out the methods of the invention or arrivation; methods for the identification of the polymuclectide and/or polypeptide; and 767 contig sequences corresponding to the cDNA sequences of the invention or expression or activity of the polymuclectide and/or polypeptide; and 767 contig sequences corresponding to the cDNA sequences of the invention are togeth in diagnostics, drug screening, forensics, gene mapping, in the contiguation of mutations responsible for genetic disorders of other traits, for assessing biodiversity, and in producing many other types of data and products dependent on DNA and amino acid sequences. They are also used for treating diseases such as Parkinson's disease, Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New polynucleotide and polypeptide useful for diagnosing, preventing or treating conditions such as neurodegenerative diseases, anemias, platelet disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or
                                                                                                                                                                                                                                                                                                                                                                        biodiversity assessment: Parkinson's disease; Alzheimer's disease; neurodegenerative diseases; anaemia; platelet disorder; wound; burns; ulcers; osteoporosis; autoimmune disease; cancer; molecular weight marker: food supplement; antiparkinsonian; nootropic; neuroprotective; antianaemic; anticoagulant; thrombolytic; vulnerary; antiulcer; osteopathic; immunosuppressive; antiinflammatory; cytostatic; gene therapy; chromosome 8p23.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Wehrman T;
                                                                                                                                                                                                                                                                                                                                                         Human; diagnostic; drug screening; forensics; gene mapping;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Wang J,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Wang Z,
                                                                                                                                                                                                                                                                                                          Human novel polypeptide sequence, SEQ ID NO:1285.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Tang TY, Zhang J, Ren F, Xue AJ, Zhao QA,

disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or cancer. The nucleic acids may also be used as hybridisation probes or primers, and in the recombinant production of a protein. The polypeptides are also useful in generating antibodies, as molecular weight markers, and as food supplements. The present sequence represents a specifically claimed human polypeptide sequence of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fire the whollished_pct_sequences.

Liu H; Hahn C, WPI; 2003-721759/68. N-PSDB; ADC27030 New isolated polynucleotide encoding human deubquitinating proteases, useful for identifying e.g. antiinflammatory or immunosuppressive agents, also the encoded polypeptides.

Claim 2; SEQ ID NO 28; 201pp; English.

8. Also described is a method for reducing inflammation, modulating autoimmune diseases and modulating immune reactions during infections by administering a compound (A) that inhibits (I) or alters regulation of the transcription of mucleic acid sequences encoding (I). (I) has antiinflammatory and immunosuppressive activities, and can be used in the regulation of cytokine/cytokine receptor signaling involved in lymphocyte proliferation. (I) can be used for identifying their respective inhibitors (A). (A) are useful for reducing inflammation and to modulate The present invention describes human deubiquitinating protease enzymes (I), designated hDUB. The enzymes designated hDUB4 are located on chromosome 4, and the enzymes designated hDUB8 are located on chromosome autoimmune diseases or immune reactions during infections. The present

```
The invention relates to a number of primate and/or rodent proteins, and the genes which encode them. The invention encompasses human dendritic cell prostaglandin transporter (DC-PGT); the TWF (tumour necrosis factor) receptor family-related proteins UPTEA84, HSLUD37R and RAWKL; human CC chemokine HCC5; human deubiquitinating proteins Dubl1 and Dub 12; human CC ligands for proteins comprising a leucine-rich motif (LRR); human cyclin E2; cDNAs encoding these proteins; and antibodies against these proteins. The proteins can be used for modulating the physiology or development of a cell. They can be used to mediate uptake of substrates (e.g., prostaglandin-like molecules), to modulate or mediate cellular interactions (e.g., induce or prevent trafficking, proliferation, or differentiation of cells), or are intracellular proteins which are differentiation of cells), or are intracellular proteins which are differentiation of cells, or are intracellular proteins which are differentiation of cells). The products can be used for treating medical conditions such as immune, inflammatory or allergic disorders, or

Claim 1; Page 10-11; 77pp; English

```
The present invention describes primer sets for synthesising 5602 full-
length cDNAs defined in the specification. Where a primer set comprises:

(a) an oligo-dr primer and an oligonucleotide complementary to the
complementary strand of a polymucleotide which comprises one of the 5602
nucleotide sequences defined in the specification, where the
oligonucleotide comprises at least 15 nucleotides; or (b) a combination
of an oligonucleotide comprising a sequence complementary to the
complementary strand of a polynucleotide which comprises a 5'-end
sequence and an oligonucleotide comprises a 3'-end sequence complementary to a
polynucleotide which comprises a 3'-end sequence, where the
complementary strand of a polynucleotide sand the combination of
complementary strand of a polynucleotide and the complementary to a
polynucleotide comprises a 1'-end sequence, where the
complementary transities at least 15 nucleotides and the combination of
the 5'-end sequence 3'-end sequence is selected from those defined in the
specification. The primer sets can be used in antisense therapy and in
gene therapy. The primers are useful for synthesising polynucleotides,
particularly full-length cDNAs. The primers are also useful for the
                                                                                                                                                                                                                  ö
            The invention relates to a novel chemokine, de-ubiquitination or cell surface protein. The composition is useful for modulating physiology or development of a cell or tissue culture cells. The present sequence represents the amino acid sequence of the human de-ubiquitination protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; primer; detection; diagnosis; antisense therapy; gene therapy.

Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length

Claim 8; SEQ ID NO 17235; 2537pp + Sequence Listing; English.

CDNAS

The present invention describes primer sets for synthesising 5602 fulllength cDNAs defined in the specification. Where a primer set comprises:

(a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 3'-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 3'-end sequence, where the polynucleotide comprises a 1'-end sequence is selected from those defined in the sylvent sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides,

0
particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13631 to AAH18742 represent human cDNA sequences, AAB2446 to AAB95893 represent human amino acid sequences, and AAH13639 to AAB95893 represent human amino acid sequences, and AAH13639 to AAB95893 oligonuclectides, all of which are used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                Gaps

New protease (inhibitors) useful for diagnosis and treatment of autoimmune/inflammatory disorders such as acquired immunodeficiency syndrome, Cushing's disease, Addison's disease and cell proliferative disorders such as cancer.

```
AARB1/14 TO AARB1/40 ENDOGE CLE HUMBAIN PLOTESTERS BIGG (PPIMS) given in AABP1/4668 to AABP1/694. The PPIMS can have activities such as: anti-human immunodeficiency virus (HIV); antidiabetic; antithyroid; as: anti-human immunodeficiency virus (HIV); antidiabetic; antithyroid; immunostimulant; immunomodulator; antiinflammatory; immunosuppressive; compinatoropic; antigorit; thyromimetic; cytostatic; antibacterial; cytuncide; antipacterial; and hepatotropic. PPIM polymucleotide and virucide; antipsoriatic; and hepatotropic. PPIM polymucleotide and virucide; antipsoriatic; and hepatotropic. PPIM polymucleotide and prevention protein sequences can be used in the diagnosis, treatment and prevention of autoimmune/inflammatory disorders such as AIDS, DiGeorge's syndrome, of autoimmune/inflammatory disorders such as AIDS, DiGeorge's syndrome, cashing's disease, Addison's disease, autoimmune thyroiditis, syndrome, Cushing's disease, Addison's disease, autoimmune thyroiditis, syndrome, sistenses, Hashimoto's thyroiditis Sjogren's syndrome, Merner's Grave's disease, Hashimoto's thyroiditis Sjogren's syndrome, Merner's complymucleotide sequences and litus, psoriasis and cancer. PPIM catheroscletrosis, cirrhosis, hepatitis, psoriasis and cancer. PPIM catheroscletrosis of diseases. They can also be used in generating genomic hybridisation probes useful in mapping the naturally occurring genomic chybridisation probes useful in mapping the naturally occurring genomic constants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            LHSNSLENPTKPVPSSTITNSAVQSTSNASTMSVSSKVTKPIPRSESCSQPVMNGKSKLN 600

This invention relates to the DNA and protein sequences of novel isolated human proteases (RRIS). the protein sequences of the invention are useful for screening a compound for effectiveness as an agonist or antegonist of its activity, the identified agonist and antagonist are useful for reparing a disease or condition associated with decreased or overexpression of functional PRIS in a patient. The PRIS protein is also useful as an immunogen for preparing polycional or monoclonal antibodies by hybridoma technology. An antibody that binds the PRIS proteins is by hybridoma technology. An antibody that binds the PRIS proteins is useful for detection and purification of the proteins and can be used to useful for detection and purification of the proteins and can be used to subject or in a biological sample. The sequences of the invention are Lee EA, Hafalia AJA, Yue H, Lal PG, Yao MG, Lu Y, Walia NK; Warren BA, Lu DAM, Baughn MB, Delegeane AM, Burford N, Borowsky ML; Lee S, Xu Y, Griffin JA, Kallick DA, Gandhi AR, Arvizu C, Ison CH; Tang YT, Azimzai Y, Eliliott VS, Swarnakar A, Ramkumar J, Nguyen DB; Tribouley CM, Lo TP, Au-Young J, Thangavelu K, Kearney L; preventing or treating disease, hepatitis, Cushing's 720 720 Protease; human; gastrointestinal disorder; gastritis; atherosclerosis; ulcerative colitis; Reye's syndrome; cardiovascular disorder; enzyme; hypertension; myocardial infarction; autoimmune disease; AIDS; PRTS; firlammatory disorder; acquired immunodeficiency syndrome; asthma; Grave's disease; cell proliferative disorder; hepatitis; psorlasis; leukaemia; developmental disorder; Cushing's syndrome; impotence; epithelial disorder; dermatitis; scabies; eczema; neurological disorder; Parkinson's disease; dementia; Alzheimer's disease; infertility; Huntington's disease; multiple sclerosis; reproductive disorder. length conva defined in the specification. Where a primer set comprises:

(a) an oligo-dT primer and an oligonucleotide complementary to the
complementary strand of a polynucleotide which comprises one of the 5602
nucleotide sequences defined in the specification, where the
oligonucleotide comprises at least 15 nucleotides; or (b) a combination
of an oligonucleotide comprising a sequence complementary to the
complementary strand of a polynucleotide which comprises a 5'-end
sequence and an oligonucleotide comprising a sequence complementary to a
polynucleotide which comprises a 1'-end sequence, where the
oligonucleotide which comprises a 1'-end sequence, where the
coligonucleotide comprises a 1'-end sequence of the combination of
the 5'-end sequence/3'-end sequence is selected from those defined in the
specification. The primer sets can be used in antisense therapy and in
c gene therapy. The primer sets can be used in antisense therapy and in
c gene therapy. The primers are useful for synthesising polynucleotides,
c particularly full-length cDNAs. The primers are also useful for the
detection and/to diagnosis of the abnormality of the proteins encoded by
the full-length cDNAs. The primers are also wobtaining of the full-length
cDNAs easily without any specialised methods. AAH03166 to AAH03628 and
AAH03633 to AAH03642 represent human cDNA sequences; AAH03166 to AAH03628 and
represent human amino acid sequences; AAH03166 to AAH03628
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Primer sets for synthesizing polynucleotides, particularly the 5602 full length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               represent human amino acid sequences, and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes primer sets for synthesising 5602 full-
                                                                                                                                                                     Human; primer; detection; diagnosis; antisense therapy; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Yamamoto J;

The invention relates to an isolated polymucleotide (I) comprising a nucleotide sequence selected from any of 948 sequences (ABZ1119-C nucleotide sequence selected from any of 948 sequences (ABZ1119-C nucleotide sequences (ABZ1119-C ABZ12066) or their mature protein coding portion, active domain coding protein or complementary sequences. The polymucleotides are useful for identifying expressed genes or for physical mapping of human genome. The encoded polypeptides (AEP68902-ABP68849) are useful as molecular weight concered polypeptides (AEP68902-ABP68849) are useful as molecular weight concered proliferative disorders (cancer), neurodegenerative diseases (Parkinson's proliferative disorders (cancer), neurodegenerative diseases (Parkinson's disbetes, lupus) genetic disorders, well or lymphoid disorders, con lung fibroals, infections (Bacterial, viral, fungal, parasitic), arthritis, etc. Note: The sequence data for this patent did not form part directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

New polynucleotides comprising sequences assembled from expressed sequence tags (ESTs), useful for treating cell-proliferative, neurodegenerative, autoimmune, genetic, myeloid or lymphoid, or platelet

Claim 9; SEQ ID NO 1338; 1012pp + Sequence Listing; English

or coagulation disorders.

New human ubiquitin protease, a member of the mammalian deubiquitinating enzymes is useful for diagnosis and treatment of e.g. tuberculosis and Alzheimer's disease.

Claim 5; Fig 1; 111pp; English.

The present sequence is human ubiquitin protease 23431. The ubiquitin protease coding sequence and protein are useful as reagents or targets in disasys for treatment and diagnosis of ubiquitin-mediated or -related disorders, especially disorders mediated by deubiquitinating enzymes. The protein and coding sequence are also useful for treating disorders involving the following: the spleen e.g. tuberculosis and typhoid fever, the lung such as bronchial asthma, the colon e.g. as diarrhoea and dysentery, the liver e.g. jaundice and rohlestasis, the uterus and endometrium e.g. endometritis, the brain e.g. acute meningitis and Alzheimer disease, T-cells including transplant rejection and autoimmune diseases such as systemic lupus erythematosus, diseases of the skin such

Rudolph-Owen LA;

nucleic acid or polypeptide, useful for preparing a composition for diagnosing or treating diseases e.g., tumor.

Claim 9; Fig 1; 281pp; English.

The invention relates to a new isolated nucleic acid molecule encoding one of 6 polypeptides (ubiquitin protease, lipase, Dynamin, short chain dehydrogenase, ADAW-TS (a disintegrin and metablloprotease domain protein dehydrogenase, ADAW-TS (a disintegrin and metablloprotease domain protein with thrombospondin (TS) domains) and gamma butyrobetaine-hydroxylase (gamma BBH). Also included are the polypeptide, host cells containing the nucleic acids, an antibody that selectively binds to the polypeptide, a method for producing the polypeptide or the nucleic acid in a sample, a method for compound that binds to the polypeptide a method for identifying a compound that binds to the polypeptide or method for identifying a compound that binds to the polypeptide. The nucleic acid or polypeptide is useful for preparing a composition for diagnosing or treating diseases e.g. spleen disorders (e.g. splenomegaly and Hodgkin's colloquises, colitis, inflammatory bowel distress syndrome, collomorary oedema, chronic bronchiis and emphysema), colon disorders (e.g. adultammatory bowel disease and Crohn's disease), liver disorders (e.g. jaundice, cirrhosis, hepatitis and alcoholic liver disorders (e.g. jaundice, cirrhosis, hepatitis and alcoholic liver disease, parkinson's disease, parkinson's disease, ataxia and multiple sclerosis), T-cell disorders (e.g. urticaria, dermatitis and lupus erythematosus), heart disorders (e.g. urticaria, dermatitis and lupus erythematosus), heart disorders

(e.g. ischaemic heart disease, myocardial infarction and cardiomyopathy), blood vessel disorders (e.g. atherosclerosis, thrombophlebitis and Raynaud disease), red blood cell disorders (e.g. anaemia), thymus disorders (e.g. DiGeorge syndrome), B-cell disorders (e.g. leukaemia), kidney disorders (e.g. polycystic kidney disease and glomerulonephritis), breast disorders (e.g. mastitis), testicular disorders (e.g. sexually transmitted diseases and cryptorchidism), thyroid disorders (e.g. sexually hypothyroidism), pancreatic disorders (e.g. pancreatitis), and intestinal disorders (e.g. whipple disease), as well as tumours and cancers of the above listed organs/Cells. Many more diseases and disorders are listed in the specification. ABL39691 to ABL39818 represent novel human nucleic acid sequences encoding the proteins given in ABB06037 to ABB06164. The novel sequences (NS) can have veytostatic, osteopathic, gynaecological, neuroprotective, antitrheumatic, antiarthritic, antipsoriatic, ophthalmological, virucide, vasotropic, antiarthritic, antiinfarility, cardiovascular, virucide, anorectic, muscular, anti-HIV, antiinfarthity, cardiovascular, anti-HIV, antiinfarmatory, dermatological, anticoagulant, anticibrinolytic, hypotension, antiasthmatic, cardiovascular, anticorporate, anticorporate, immunomodulator, anticonvolsant, antidiabetic, tranquilliser, antiulcer, antidepressant, gastrointestinal, aeuroleptic, cerebroprotective, cortropic and contraceptive activities. The NS can be used in vaccines, contibodies from the present invention can be used for treating and diagnosing e.g. cancer, osteoporosis, endometriosis, degenerative clisance, osteoporosis, endometriosis, degenerative contents of seases, dystonia, multiple solerosis, inflammation, skin disorders, inflammation, skin disorders, inflammation, asthmatical and incomed contraced con disease, coagulation disease, ischeemia, hypertension, asthma, immune disease, epilepsy, angina, neurodegeneration, diabetes, anxiety, depression, schizophrenia, viral disease, gastric ulcers, stroke, Alzheimer's disease and as a contraceptive

2003-636732/60.

New human diagnostic and therapeutic polynucleotides and polypeptides, useful for diagnosing, treating or preventing e.g. leukemia, brain cancer, atherosclerosis, AIDS, thyroiditis, infections, obesity, stroke or Alzheimer's.

Claim 27; SEQ ID NO 198; 634pp; English.

The invention relates to a novel isolated human diagnostic and therapeutic polynucleotide (designated dithp). The novel dithp cherapeutic polynucleotide (designated dithp). The novel dithp comprises: any of 188 DNA sequences consisting of polynucleotide some pairs fully defined in the specification; a polynucleotide or lasst 90% identical to the dithp polynucleotide; a polynucleotide complementary to identical to the dithp polynucleotide which is at least 90% identical to a RNA equivalent of any of the polynucleotides mentioned above. The dithp polynucleotides have the following activities: the dithp polynucleotides have the following activities in antidiabetic, immunosuppressive, neuroprotective, antidiabetic, national antibacterial, fungicide, antidates mentioned are repeated to antidate the memoratic, anti-HLV, antidated, antidates, antidiabetic, antidated antibacterial, anorectic, vascoropic, and antidates; controlled the memoratic, anti-HLV, antidated, antidates polymeptide can be used in gene therapy and protein replacement therapy. The dithp polynucleotides polypeptide can be used in gene therapy and protein replacement therapy. The dithp polynucleotides or DITHP polynucleotides polypeptide can be used in gene therapy and protein replacement therapy. The dithp polynucleotides or DITHP polynucleotides polypeptide can be used in gene therapy and protein replacement therapy. The dithp polynucleotides or DITHP polynucleotides polypeptide can be used in gene therapy and concer, broad cancer, cancer, preast cancer, anxiety, schizophrenia), gastrointestinal disorders (e.g. ulcers), transport disorders (e.g. akinesia or multidrug resistance), or connective tissue disorders (e.g. Paget's disease or rickets). This sequence represents one of the human DITHP polypeptides of the invention.

The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises:

(a) an oligo-dr primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination
                                                                                                                                                                                                                                                                                   725
                                                                                                                                                                                                                                                                                                                   847
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       5602 full.
                                                                                            550
                                                                                                                           710
                                                                                                                                                           909

                                                                                                                                                                                                                                                                                                                                                                       The present sequence is human ubiquitin protease belonging to the family of mammalian deubiquitinating enzymes. This ubiquitin protease is encoded by the cDNA insert of plasmid deposited with ATCC NO: FPT-1849. Ubiquitin protease is highly expressed in foetal kidney, testes, foetal liver, ovary and foetal heart. It is also expressed in liver, breast, lung, and colon tissue and in liver metastasis derived from malignant colon tissues. Ubiquitin protease is useful for treating disorders mediated by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        25;

polynucleotide which comprises at 3'-end sequence, where the coligonucleotide which comprises at least 15 nucleotides and the combination of the 5'-end sequence, 3'-end sequence is selected from those defined in the specification. The primer sets can be useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the phormality of the proteins encoded by CDNAs easily without any specialised methods. AAH1316 to AAH13628 and AAH13633 to AAH18742 represent human DNA sequences; AAH33629 to AAB92446 to AAB98893 represent human amino acid sequences; and AAH13629 to AAB98893 represent human amino acid sequences; and AAH13629 to AAB98893 represent human amino acid sequences; and AAH13629 to AAH13832 represent plum are used in the exemplification of the of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a 102 113 162 173 222 HTQATTLVCQIFGGYLRSRVKCLNCKGVSDTFDPYLDITLEIKAAQSVNKALEQFVKPEQ 282 233 342 402 QAYVLFYIRSHDVKNGGELTHPTHSPG-QSSPRPVISQRVVTNKQAAPGFIGPQ-LPSHM 460 461 IKNPPHINGTGPL--KDTPSSSMSSPNGNSSVNRASPVNASASVQNWSVNRSSVIPEHPK 518 47 23 414 QAYVLFYLR------IPGSKKSPEGLISR---TGSSSLPG--RPSVIPDHS 453 572 MSVSSKVTKPIPRSESCSQPVMNGKSKLNSSVLV-PYGAESSEDSDEESKGLGKENGIGT 630 1 MTIVDKASESSDPSAYQNQPGSSEAVSPGDMDAGSASWGAVSSLNDV----------SNHTLSLGPVPGAVVY-SSSSVPDKSKPSPQKDQALGDGIAPPQKVLFPSEKICLK | : | | : | | : | | : | | : | | : | | EALKSKYVLINPKTEGASRHKSGDDPPARRQGSEHTYESCGDGVPAPQKVLFPTERLSLR WQQTHRVGAGLQNLGNTCFANAALQCLTYTPPLANYMLSHEHSKTCHAEGFCMMCTMQAH ITQALSNPGDVIKEMFVINEMRRIARHLRFGNQEDAHEFLQYTVDAMQKACLNGSNKLDR IVQAFANSGNAIKPVSFIRDLKKIARHFRFGNQEDAHEFLRYTIDAMQKACLNGCAKLDR LDGENSYKCSKCKKMVPASKRFTIHRSSNVLTLSLKRFANFTGGKIAKDVKYPEYLDIRP 519 KQKITISIHNKLPVRQCQSQPNLHSNSLENP----TKPVPS---STITNSAVQSTSNAST YMSQPNGEPIVYVLYAVLVHTGFNCHAGHYFCYIKASNGLWYQMNDSIVSTSDIRSVLSQ 454 KKNIGNGIISSPLTGKRQDSGTMKKPHTTEEI--GVPISRNGSTLGLKSQNGCIPPKLPS GS------PSPKLSQTPTHMPTILDDPGKKVKKPAPPQHFSPRTAQGLPGTSNSN-561 ---SSRSGSQRQGSWGSRDVVLSTSPKLLATATANGHGLK----GNDESAGLDR-RGSSS Gaps Query Match 35.0%; Score 1422.5; DB 4; Length 954; Best Local Similarity 41.1%; Pred. length cDMAs defined in the specification. Where a primer set comprises:

(a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the nucleotide comprises at least 15 nucleotides; or (b) a combination of a noligonucleotide comprises at least 15 nucleotides; or (b) a combination of a noligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a coligonucleotide comprises a 3'-end sequence, where the coligonucleotide comprises a 3'-end sequence, where the coligonucleotide comprises a 1'-end sequence, where the coligonucleotide comprises as a 1'-end sequence, where the complementary to a polynucleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence, be used in antisense therapy and in the specification. The primers act be used in antisense therapy and in the gene therapy. The primers are useful for synthesising polynucleotides, detection and/or diagnosis of the abnormality of the proteins encoded by contain and/or diagnosis of the abnormality of the proteins encoded by contain and any specialised methods. AMH3632 represent human annino acid sequences; and AMH3629 to AMH3632 represent colligonucleotides, all of which are used in the exemplification of the praces of the absorption of the praces of the absorption of the praces of the absorption of the praces of the absorption of the praces of the absorption of the praces of the absorption of the praces of the absorption of the praces of the absorption of the praces of the absorption of the praces of the absorption of the praces of the absorption of the praces of the absorption of the praces of the absorption of the praces of the absorption of the praces of the absorption of the praces of the absorption of the praces of the absorption of the praces of the absorption
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Primer sets for synthesizing polymuclectides, particularly the 5602 full length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length

                                                                                                                                                                                                            The present invention describes human deubiquitinating protease enzymes (I), designated hDUB. The enzymes designated hDUB4 are located on chromosome 4, and the enzymes designated hDUB8 are located on chromosome 8. Also described is a method for reducing inflammation, modulating autoimmune diseases and modulating immune reactions during infections by administering a compound (A) that inhibite (I) or alters regulation of the transcription of mucleic acid sequences encoding (I). (I) has antiinflammatory and immunosuppressive activities, and can be used in the regulation of cytokine/cytokine receptor signaling involved in lymphocyte proliferation. (I) can be used for identifying their respective inhibitors (A). (A) are useful for reducing inflammation and to modulate autoimmune diseases or immune reactions during inflammations. The present sequence represents hDUB4.8 from the present invention.

The invention relates to an isolated 68999 nucleic acid molecule which encodes a ubiquitin carboxyl-terminal hydrolase. The mucleic acid molecules, polypeptides and antibodies are useful in screening assays, molecules, polypeptides and antibodies are useful in screening assays, predictive medicine (e.g. diagnostic assays, prognostic assays, the monitoring clinical trials and pharmacogenetics) and prophylactic and therefore and polypeptide may be used for treating in chromosome mapping, tissue typing and forensic biology and as surrogate markers. The nucleic acid and polypeptide may be used for treating, preventing and/or proliferation and/or differentiation disorders, such as cell proceders of social disorders (e.g. Parkinson's or Alzheimer's disease), infections (e.g. viral, bacterial or parasitic), bone metabolism disorders (e.g. osteoporosis and rickets), immune disorders (e.g. dispetes and multiple sclerosis), cardiovascular disorders (e.g. arrhythmias congestive heart failure), blood vessel disorders (e.g. arrhythmias congestive heart failure), blood vessel disorders (e.g. arrhythmias congestive heart failure), blood vessel disorders (e.g. arrhythmias congestive heart failure), blood vessel disorders (e.g. e.g. hundrensian and weared and multiple sclerosis) cardiovascular disorders (e.g. arrhythmias congestive heart failure), and vessel disorders (e.g. e.g. hundrensian and weared and multiple sclerosis).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      KVLFPSEKICLKWQQTHRVGAGLQNLGNTCFANAALQCLTYTPPLANYMLSHEHSKTCHA 150

The present invention describes human deubiquitinating protease enzymes (I), designated hDUB. The enzymes designated hDUB4 are located on chromosome 4, and the enzymes designated hDUB8 are located on chromosome 9. Also described is a method for reducing inflammation, modulating autoimmune diseases and modulating immune reactions during inflammation administering a compound (A) that inhibits (I) or alters regulation of the transcription of mucleic acid sequences encoding (I). (I) has antiinflammatory and immunosuppressive activities, and can be used in the regulation of cytokine/cytokine receptor signaling involved in lymphocyte
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated polynuclectide encoding human deubquitinating proteases, useful for identifying e.g. antiinflammatory or immunosuppressive agents, also the encoded polypeptides.
                                                                                                                                                  399
                                                                                                                                                                              495
